Company 18 · DIGITAL IMPOSTERS PVT. CO., LTD. — UniLab

15

students interviewed
22 Aug – 8 Sep 2026

12

pains recorded
six we did not predict

5:00

on the clock
ten slides, five speakers

Before the room — 15 minutes, in this order

WHO	DO THIS	WHY IT MATTERS
Thiha Lin	Laptop on the projector. Open <code>thiha-lynn.github.io/unilab</code> , open Compress PDF , and drop a real PDF on it while still online . Then switch to airplane mode.	The tool module is lazy-loaded. Loaded online once, it runs offline. Going offline <i>first</i> gives you a spinner, not a demo.
Thiha Lin	Second tab: the deck. Third tab: <code>results.md</code> on GitHub, in a logged-out window.	"Tell me about one of them" is answered from the log, not from memory. Logged-out proves the repo is public.
Myo Zin Thant	Confirm the Classroom submission shows the link <code>github.com/Thiha-Lynn/unilab</code> .	The grader opens the link, not the laptop.
Zaw Win Htut	Phone open at your three participants — S1, S6, S11.	Backup if the laptop tab dies.
Wanna San	Three numbers in your head: P7 seven, P6 seven, P10 six .	Slide 3 is numbers. Say them, don't read them off the chart.
Everyone	Re-read your own three blocks in <code>results.md</code> — not all fifteen.	The follow-up question goes to the interviewer, not to whoever is holding the clicker.

#	SLIDE	SPEAKER	TIME	IF THE CLOCK IS AHEAD OF YOU
0	UniLab · the one line	Myo Zin Thant Product Owner	15 s	—
1	One workflow, fifty-eight settings	Myo Zin Thant Product Owner	30 s	cut to 20 s — drop the category strip
2	Fifteen people, fifteen programmes	Swan Htut Oakkar Aung Designer	40 s	cut to 30 s
3	What they said — twelve pains	Wanna San AI Lead	60 s	cut to 50 s — drop the out-of-scope line
4	One thread, six documents	Thiha Lin Tech Lead	50 s	cut to 40 s
5	What we got wrong	Zaw Win Htut QA / Test	50 s	cut to 40 s
6	It runs with the Wi-Fi off	Thiha Lin Tech Lead	45 s	never cut this one
7	Compliance is architecture	Zaw Win Htut QA / Test	25 s	cut to 10 s — the bold sentence only
8	What is still open	Myo Zin Thant Product Owner	25 s	cut to 20 s
9	Questions	all five	—	—

5:00 with the cuts, 5:40 without. Every cut listed above is the *last* sentence of that slide's script, so dropping it never breaks the hand-off to the next speaker. **Never cut slide 6** — the offline demo is the one thing nobody else in the room can do.

The hand-offs, in order

Each speaker ends by naming the next one. Say the hand-off line even if you have cut the rest — it is what stops the pause between speakers.

1. **Myo** opens and stays on for slide 1 → "Swan will tell you who we talked to."
2. **Swan** gives the sample → "Wanna has what they said."
3. **Wanna** gives the twelve pains → "Thiha will take one of those all the way to the screen."
4. **Thiha** walks the chain → "Zaw has the part we got wrong."
5. **Zaw** gives the two that failed → "Thiha — Wi-Fi off."
6. **Thiha** runs the demo → "Zaw — the law, in one line."
7. **Zaw** gives the one compliance sentence → no hand-off; **Myo** closes.
8. **Myo** names what is open, then: "Questions."

Company 18 · DIGITAL IMPOSTERS PVT. CO., LTD. · github.com/Thiha-Lynn/unilab · thiha-lynn.github.io/unilab

The file never leaves the device.

SAY THIS

Good morning. Company 18, DIGITAL IMPOSTERS. Our product is **UniLab**: a student's file jobs — compress, convert, scan, trim — done entirely inside the browser, so **the file never leaves the device**. Five of us, five minutes, and the first thing we'll tell you is how many people we talked to.

→ stay on for slide 1.

While you say it — Say the five names or point at them. Do not read the three number cards — they are there for the reviewer, not for you.

THE PRODUCT · ONE CORE WORKFLOW

MYO ZIN THANT · 30 S

One workflow, fifty-eight settings.

1 · SELECT
Pick a file on this device
Phone camera roll, Files, a drag onto the page. Type and size screened on every path.

→

2 · TRANSFORM ON THIS DEVICE
The whole job runs in the tab
pdf.js · WebCodecs · Tesseract · RNNoise, all in the browser. **No upload endpoint exists in the codebase.**

→

3 · DOWNLOAD
Take the result — and watch it expire
Held in memory only, 30:00 countdown, *Delete now*, purge on tab close. Proven by test.

58 tools are 58 *settings* of that one workflow — not 58 workflows. Split PDF and Remove Noise differ in what they compute, not in what the student does.

PDF 20 Image 13 Audio 11 Video 7 Everyday 3 Text 2 Study 2

— eighteen video and audio settings: the part no free PDF site has at all.

58 tools are 58 settings of one workflow, not 58 workflows.

SAY THIS

One core workflow: **select a file, transform it on this device, download the result.** We ship fifty-eight tools, and every one of them is a *setting* of that workflow — not fifty-eight workflows. Split PDF and Remove Noise differ in what they compute, not in what the student does. That sentence is our answer to the one-month, one-workflow guardrail.

Hard cut: stop here. Twenty of those settings are PDF, thirteen image, eighteen video and audio — the part no free PDF site has at all.

Hand-off: "Swan will tell you who we talked to."

While you say it — This is the answer to the one-month, one-workflow guardrail. Say it before anyone can count the tools and call it sprawl.

IDENTITY DOC

4 of 15 — passport, medical certificate, Thai ID, signed permission sheet

RECORDED

role · pain · quote. **No names, no student IDs** — anywhere (LR7)

Fifteen people, fifteen programmes — and nobody from this course.

SAY THIS

Fifteen people, fifteen programmes, between the twenty-second of August and last night. Three each — this grid is the assignment: each row is one of us. Nursing, Law, Public Health, Accounting, Chemistry — nobody from this course. Ten by chat, two in person, three by call. Nine in English, four in Thai, two in Burmese.

Two numbers that shaped everything: **five never touched a laptop**, seven more started on the phone. And four of the fifteen were handling an identity document — a passport, a medical certificate, a Thai ID, a signed permission sheet.

We recorded role, pain and quote. No names, no student IDs, anywhere.

Hand-off: "Wanna has what they said."

While you say it — Point at the grid rows: each row is one of us, three each. Then the two numbers that changed the product: five never touched a laptop, four handled an identity document.

EVIDENCE · TWELVE PAINS, BY HOW MANY RAISED EACH UNPROMPTED

WANNA SAN · AI LEAD · 60 S

What they said.

7 of 15

found out about the limit only after the work was done. "Upload failed" — no reason. "File type not supported" — no fix. The pain no hypothesis predicted, and the one our estimate-before-the-run already answers.

6

pains nobody predicted. Six hypotheses became pains; six more pains arrived on their own, including the largest.

2

recorded and not ours. The LMS itself, and Word's export — written down as boundaries, not hidden.

The pain is rarely "I can't make a PDF." It's the workflow around it — and the limit you meet afterwards.

The pain is rarely "I can't make a PDF." It's the workflow around it.

SAY THIS

Twelve pains. Six we had predicted. **Six we hadn't** — and the biggest one is in that second group.

P7. Seven of fifteen found out about the limit only after the work was done. "Upload failed" — no reason. "File type not supported" — no fix. A watermark after six pages were scanned. A rotation the lecturer noticed. Nobody was stopped by a PDF; they were stopped by finding out too late.

P6, also seven: one submission is a chain of three to five apps, and — their words — they want *one place*. P10, six: it starts on a phone and every hop to a laptop is where the time goes. Then the ones we predicted: the free tool running out at the deadline, four. Custody of an ID document, four. A size cap you discover by failing, four.

Hard cut: skip this sentence. Two more we recorded and don't own — the LMS itself, and Word's export — so the boundary is written down, not hidden.

The pain is rarely "I can't make a PDF." It's the workflow around it, and the limit you meet afterwards.

Hand-off: "Thiha will take one of those all the way to the screen."

While you say it — Say the numbers, do not read the chart. P7 seven, P6 seven, P10 six. Land on P7 being the one no hypothesis predicted.

Pain, requirement, backlog, screen — the same thread, every document.

SAY THIS

One thread, six documents. S12, fourth-year, scholarship application, second of September. Went to a copy shop to scan a transcript and a Thai ID. Their words: **"I asked them to delete the files afterward, but realistically I can't verify whether every temporary copy was removed."**

That's pain P2 — four of fifteen said it. So requirement F1: transform with no upload. F6: the result lives in memory, on a countdown, with a delete-now button — so custody is something she can *watch*, not a promise she has to trust. Backlog B1 and B6, both done, vault.js, and a test that resolves the object URL after the purge to prove the bytes are gone — not just unlisted. And that's screen three: **29:47 until this is gone.**

Pain, requirement, backlog, screen. Same thread, every document.

Hand-off: "Zaw has the part we got wrong."

While you say it — Walk left to right along the row with your hand. The quote is S12's, so if the reviewer asks who that is, Myo interviewed them.

EVIDENCE · NINE HYPOTHESES, AFTER FIFTEEN CONVERSATIONS

ZAW WIN HTUT · QA / TEST · 50 S

What we got wrong.

H1	Free tools ration the work; the cap lands at the deadline	→ P1 · 4 of 15
H2	An ID document uploaded is in someone else's custody	→ P2 · 4 of 15
H3	On campus Wi-Fi the upload is part of the wait	→ P3 · 3 — still untimed
H4	iPhone HEIC photos get rejected	→ P4 · 2 of 15
H5	Size caps force compression against a specific number	→ P5 · 4 — number usually unknown
H6	Thai / Burmese scans are unsearchable, so quotes get retyped	0 of 15 → F8 parked
H7	No one free site covers documents, video and audio	→ P6 · 7 of 15
H8	The same multi-step chore repeats every week	0 of 15, contradicted → F11 parked
H9	"Free for students" is not a differentiator	confirmed · nobody switches for free

2

features we had already built. Nobody asked. OCR in nineteen languages, saved Workflows. Not re-justified — parked: out of the requirement table, code untouched, decision written down for week six.

0 of 15

named "free" as a reason to switch. What they named: fewer steps in one place (S1, S13), no ads (S3), and local processing for identity documents (S4, S14).

Every requirement still in the spec traces to a stated pain — because we took two out.

Every requirement still in the spec traces to a stated pain — because we took two out.

SAY THIS

We went in with nine hypotheses. **Six became pains. Two got zero.**

H6: Thai and Burmese OCR. We built it — nineteen languages. Not one of fifteen mentioned searching a scan or retyping a quote. H8: the same chore every week. Zero — and one person contradicted it: *"something I only use around deadlines."*

So two features we had already shipped had nobody behind them. We didn't re-justify them. We **parked** them: out of the requirement table, code untouched, decision written down for next month. Every requirement still in the spec traces to a stated pain — because we took two out.

And H9 survived: **nobody in fifteen named "free" as a reason to switch.** What they named was fewer steps, no ads, and — for identity documents — local processing.

Hand-off: "Thiha — Wi-Fi off."

While you say it — This is the slide that earns trust. Do not soften it, do not apologise for it, and do not skip to the good news.

LIVE · THE CORE WORKFLOW, OFFLINE

THIHA LIN · 45 S · NEVER CUT

It runs with the Wi-Fi off.

1. **Show the airplane-mode icon.** "This laptop has no connection."
2. **Compress PDF** is already open with a scanned 9 MB PDF — "the size S15 got refused with last week."
3. Type the cap: **5 MB**. Read the estimate: **≈ 4.6 MB, before anything runs.** "That's F5 — and that's P7 answered."
4. **Run. Download.** Then press **Delete now** — "same purge the countdown does."
5. Close: **"Nothing left this machine, because nothing could. There is no upload endpoint in the codebase."**

Before the room, while online: open Compress PDF and drop the file on it, *then* switch to airplane mode. The tool module is lazy-loaded; loaded once, it runs offline. Offline first = a spinner, not a demo. If anything fails on stage, show the mock-up on the right and say the live product is at thiha-lynn.github.io/unilab. Do not debug in front of the room.

Prototype screen S2 (mock, from design-system.md tokens only) — the estimate sits above the button, before the run. R1: one primary action. R2: 16 px input on phones.

Nothing left this machine, because nothing could.

SAY THIS

This laptop is in airplane mode. (*show the icon*) This is a scanned PDF, nine megabytes — the same size S15 got refused with last week. I type the cap, **five**. The estimate says four point six *before* I run anything — that's F5, and that's P7 answered. Run. Download. And **Delete now** — same purge the countdown does.

Nothing left this machine, because nothing could. There is no upload endpoint in the codebase.

If the demo fails: switch to this slide's mock-up and say "the live product is at [thiha-lynn dot github dot io slash unilab](https://thiha-lynn.github.io/unilab) — the screens are the same." Do not debug on stage.

Hand-off: "Zaw — the law, in one line."

While you say it — The demo is the argument. Show airplane mode first, then the estimate before the run, then Delete now.

COMPLIANCE · RULE.MD REWRITTEN AGAINST THIS PRODUCT (W2 → LR1-LR8)

ZAW WIN HTUT · 25 S

Compliance is architecture.

LR1

No user file content leaves the device; no upload endpoint exists — PDPA minimisation

LR2

No account, email, name or phone for any tool

LR3

Network fetches carry program code or model data only, disclosed before they start — 2 of 2 tools verified

LR4

No "files never touch a server" claim unless the architecture makes it true — it does, so the privacy page reads its numbers from the code

LR5

Results in memory only, expire unaided, erasable on demand, unreachable once dropped — **proven by test**

LR6

Redaction, blurring and EXIF stripping remove content, never cover it — EXIF proven; redaction test still to write (B15)

LR7

No interview PII into an AI tool or the public repo — role, pain, quote only, kept for all 15

LR8

No filename or file content reaches the console in production

A duty you have discharged can fail. A duty you never incurred cannot.

CCA §26 access log, 90 days, a launch blocker	We store nothing for anyone. No server, no session, no IP — there is no event to log.
Consent banner, ad-script gating, DPA	No ads, no analytics, no third party collects anything through the page.
ETA §9/26 consent records	Nothing is transmitted, so nothing creates the obligation.

Written conditionally, not deleted: *if the system ever stores a file for a user, this duty returns in full.* The class draft that assumed a server is preserved verbatim beside the rewrite.

A duty you have discharged can fail. A duty you never incurred cannot.

SAY THIS

Our W2 rule.md was rewritten against this product. Eight legal requirements, PDPA, Computer Crime Act, ETA. **A duty you have discharged can fail. A duty you never incurred cannot.** No upload, so no data controller from first byte; no server, so no section - 26 log — and if a server is ever added, the rule says those duties come back in full.

Hand-off: none — Myo closes.

While you say it — If you are behind the clock, say only that sentence and hand over. The eight LRs are on screen for the reviewer to read.

UniLab · W5 gate · 9 Sep 2026 · page 10 of 14 — slide 7 of 9

HONESTLY OPEN · AS OF 9 SEP 2026

MYO ZIN THANT · 25 S

What is still open.

B17 · TOPIC**UniLab is not on the 19 Aug assigned list**

The course overview says pick your own; the slide lists five. The confirmation request is written and goes to you today — with a mapped fallback if the answer is "take one of the five".

P3 · A NUMBER**Campus Wi-Fi round trip: perception, not yet a measurement**

Three participants said the upload is the wait. UniLab's half is measured — zero network attempts across five exit APIs. The competitor's half needs campus Wi-Fi, a 10 MB fixture and three runs.

B11 · THE CENTRAL CLAIM**"No file bytes leave the device" — tested on one chain, not all 58**

Statically clean across the codebase; dynamically proven on compress → images-to-PDF. The per-tool sweep is the first BUILD-phase test.

Q5 · Q6 · PARKED**OCR and saved Workflows — re-admit or cut, in week six**

Zero of fifteen raised either. Three options each are written in the spec; the OCR branch gets asked directly in the next five interviews.

15 interviewed · 12 pains · every requirement traced · 2 parked, in the open.

Fifteen interviewed, twelve pains, every requirement traced, two parked in the open.

SAY THIS

Open, honestly: our topic isn't on the nineteenth-of-August list — the confirmation request is written and going to you today. The competitor's upload time on campus Wi-Fi is still a perception, not a number. The zero-upload claim is tested on one tool chain, not yet all fifty-eight. And the two parked features are a decision we owe ourselves in week six.

Fifteen interviewed. Twelve pains. Every requirement traced. Two parked, in the open. Questions.

While you say it — Say the open items before anyone asks for them. A team that volunteers its gaps is read as a team that knows where it stands.

COMPANY 18 · DIGITAL IMPOSTERS PVT. CO., LTD.

ALL FIVE

Questions.

github.com/Thiha-Lynn/unilab · start at .docs/01-requirements/TRACEABILITY.md · every participant at 02-interviews/results.md

"Tell me about one of them." — **whoever ran it**: role, date, task, the pain in their words, the quote. Zaw S1 S6 S11 · Myo S2 S7 S12 · Wanna S3 S8 S13 · Swan S4 S9 S14 · Thiha S5 S10 S15

"Where are the names?" — **Zaw**: nowhere, by rule LR7. Public repo. The code-to-person map was never written down

"Where's the OCR?" — **Zaw**: shipped, parked. Zero of fifteen asked. Spec §2.1, Q5

"Biggest surprise?" — **Wanna**: P7. Nobody was stopped by a PDF; seven were stopped by finding out too late

"Why isn't UniLab on the topic list?" — **Myo**: overview says pick your own; confirming today; fallback mapped to Internship Management System, rule.md and the tests transfer

"Fifty-eight tools in a month?" — **Myo**: fifty-eight settings of one workflow; the core feature is what month two must ship end to end

"Every requirement traces to a pain?" — **Thiha**: every F, NFR and LR — the spec has the column. Two didn't, so they're out

"Is free your pitch?" — **Myo**: no. One place, fewer steps; custody for identity documents

Take the question, then hand it to the person who ran that interview.

SAY THIS

Take the question, hand it to the owner on the slide. If you don't know: "that's in the log — I'll find it," and open .docs/05-log/20260908-log.md, Addendum 3.

While you say it — Nobody answers for someone else's participant. The next page is the bank of questions and who owns each.

AFTER THE TALK The questions — and who answers

Take the question, then hand it to the person named. Answering for someone else's participant is how an honest pack starts to sound invented.

THEY ASK	WHO	SAY
"Tell me about one of them."	whoever ran it	Role, date, the task, the pain in their words, the quote. Zaw S1 S6 S11 · Myo S2 S7 S12 · Wanna S3 S8 S13 · Swan S4 S9 S14 · Thiha S5 S10 S15. Worked example, Myo on S7: first-year Traditional Chinese Medicine, sent a medical certificate to a lecturer over LINE, "I mostly think about getting it accepted" — and the photo carried a full name and a hospital number before they thought about it.
"How did you find them? Are they classmates?"	Swan	Own LINE groups and programme contacts. Nobody from this course . Chat counts — the M1 guide says a real user is anyone who has the problem and can be reached.
"Where are the names?"	Zaw	Nowhere, by LR7 — it is a public repository. Role, pain and quote only, and the code-to-person mapping was never written down.
"Fifty-eight tools in one month?"	Myo	Fifty-eight <i>settings</i> of one workflow. The core feature is the one thing month two has to ship end to end; everything else is a parameter of it.
"Why is UniLab not on the topic list?"	Myo	The overview says pick your own; the 19 August slide lists five. We built on the first and we are confirming with you today. The fallback is mapped — Internship Management System is nearest, and <code>rule.md</code> , the legal chain, the agents and the tests all transfer.
"Where is the OCR? You said nineteen languages."	Zaw	Shipped, and parked . Zero of fifteen asked for it — spec §2.1, question Q5. We ask that branch directly in the next five interviews.
"Every requirement traces to a pain?"	Thiha	Every F, NFR and LR — the spec carries the column. Two didn't, so they are out of the table rather than re-argued.
"What was the biggest surprise?"	Wanna	P7 . Nobody was stopped by a PDF; seven of fifteen were stopped by finding out too late. It is the pain our estimate-before-the-run already answered, so F5 has the strongest evidence of anything we built.
"H3 — did you measure the Wi-Fi?"	Zaw	Our half: zero network attempts across five exit APIs, measured. The competitor half needs campus Wi-Fi and has not been timed. Three participants described it — that is perception, and we say so.
"Is 'free' your pitch?"	Myo	No. Nobody in fifteen would switch for free, and two already have free tools they like. One place, fewer steps — and custody for identity documents.
"Why not ffmpeg for the video tools?"	Thiha	Thirty-one megabytes and CPU decode. We use WebCodecs through mediabunny — and video and audio are the part no free PDF site has at all.
"What is your metric?"	Myo	Files leaving the device per task: every one before, zero after. Secondary: time to a finished file — the sample's median was thirty-five minutes — and format or size rejections, which nine of fifteen hit.

If you do not know

"That's in the log — I'll find it."

Then open `.docs/05-log/20260908-log.md`,
Addendum 3. Every coding decision, every
contradiction and the full audit are in it. Looking it up in
front of the room reads as a team that keeps records.
Guessing reads as a team that does not.

The sentence to have ready

**A student cannot verify a deletion
promise, so no file may leave the
device, so the tool shows the size
before it runs, so screen S3 shows
the countdown and *Delete now*.**

That is **pain → requirement → backlog → design** in one
breath, and slide 4 is the picture of it.

And the one thing not to do

Do not answer a question about a participant you did not interview, and do not soften the two parked requirements
into something that sounds asked-for. The pack is strong *because* it says what fifteen people did not ask for.
Reading it any other way is the only version of this that falls apart under a follow-up question.
